

Tip Of The Month

Problem: The torch starts spewing out a mix of fuel and fumes instead of dripping when using a mix of diesel and gas of about 50-50. The problem may be worse on warmer days. The problem seems to get worse as the torch head gets hot.

Is there a simple fix?

We use a mix of 75% diesel and 25% gas during warm weather.

Bill Parsons, NC WRC

We're using straight kerosene in Montgomery and Stanly Counties and it seems to have eliminated the "huffing and puffing" problem.
